

MDCMS Enhancements

Version 6.3.2 is a minor release update to version 6.3. See the “new features in v6.3” and “new features in v6.3.1” for all other changes made since 6.2.

Allow multiple instances of MDCMS on the same System Partition

The product libraries MDCMS, MDXREF and MDSEC can now have any 1-4 character suffix added to the library names to allow for an unlimited number of production installation instances on the same system. This can be useful to test a new version of MDCMS or to fully separate the management of specific business applications.

Also, the temporary libraries for compiling, installing, receiving and rolling back objects may be given a prefix of your choice.

Save Promotion Packages directly onto an Optical Device

Now, in addition to using SNA or FTP connections to send promotions, or saving promotions to tape, promotion packages can be saved to an optical device such as a DVD drive.

MDXREF Enhancements

Compare Libraries across Systems

The Library Comparison report has now been enhanced to allow the comparison of some or all objects in a local library to the objects in a remote library. The results can then be viewed online, printed, or exported to a file.
