

MDCMS Enhancements

If you are installing MDCMS Version 6.5 over the top of an existing MDCMS Version, that version must be at least MDCMS Version 6.2.4. If you are currently using an older version than 6.2.4, it is recommended to first install 6.3.2. You can see which version you are currently using by typing MDCMS from a command line and looking at the bottom right of the screen.

Version 6.5 is backwards compatible, as long as the version on other systems is at least 6.2.4.

Workflow Web Application

MDWorkflow is an optional web application for managing projects, workflow processes and the tracking of objects across all systems from a single browser.

More information about MDWorkflow can be obtained from Midrange Dynamics.

RFP Submission and Installation Services

Requests for Promotion (RFPs) can now be scheduled for submission or installation far in advance and a new MDCMS service API will automatically place the RFP in the JOBQ on the scheduled day.

MDMAIL Client to Send Emails from the System i

Now included with MDCMS is a java based SMTP client. The client API is used automatically by the Workflow Application and can also be used for RFP Exit Points or for your own use.

Enhanced Delta/Emergency Library Cleanup

MDCMS can now selectively delete source and/or objects from multiple Delta and Emergency Libraries when the object is installed into the permanent library.

For Delta libraries, a check is made and the object will only be deleted if it is the same version as the object being installed into the permanent library.

The designation of an Emergency environment will allow the object to be deleted regardless of the version.
