

## **MDCMS Enhancements**

If you are installing MDCMS Version 6.7 over the top of an existing MDCMS Version, that version must be at least MDCMS Version 6.2.4. If you are currently using an older version than 6.2.4, it is recommended to first install 6.3.2. You can see which version you are currently using by typing MDCMS from a command line and looking at the bottom right of the screen.

Version 6.7 is NOT backwards compatible with older versions of MDCMS on other systems.

### **Source and Object Signing**

When source and objects (commands, programs, files, IFS files and remote objects) are installed into the development environment, they are uniquely signed by MDCMS using a one-way HMAC algorithm.

Then, as the source and/or objects are to be deployed into higher environments, such as test or production, they are signed again and the signatures are compared to the expected signatures. If there is a mismatch, then a manual modification is indicated and the installation can only occur if an authorized user approves it.

### **MDMAILF API for the Send of Customized Emails**

The MDMAILF API is similar to MDMAIL in that emails can be sent directly from the System i for MDCMS exit points or within your own applications. With MDMAILF, however, the body templates are stored in IFS without size limits and can be sent in HTML or plain text format.

### **Data Migration Enhancements**

Data for a modified physical file can now be migrated simultaneously with the format change. Multiple data sets for the same file can be requested in parallel at the same level.

### **MDWorkflow Enhancements**

- Attach files to Projects or Tasks
- Add comments to Projects or Tasks
- Email detailed Project or Task information to any involved users or user groups for a Project or Task
- Easily generate customizable Excel reports containing Project, RFP, Task, or Object information.
